Comprehension Type Questions (For JEE)

Passage - 1

Advanced countries are making use of powerful electro magnets to move trains at very high speed. These trains are called maglev trains. These trains float on a guideway and do not run on steel tail trucks.

Instead of uising an engine based on fossile fuels, they make use of magnetic field forces. The magnetized coil are arranged in the guideway which repel the strong magnets placed in the train's under carriage. This helps train move over the guideway, a technique called electrodynamics suspension. When current passes in the coils guideway, a typical magnetic field is set up between the under carriage of train and guideway which pushes and pulls the train along the guideway depending on the requirement.

The lack of friction and its aerodynamic style allows the train to move at very high speed.

143. There will be nomagnetic field at "0" due to wire AB and CD carrying current "I".

Wire carrying I_1 is also produced zero magnetic field at "0".

Mag. field at "0 due to arc AD" $= \frac{\mu_O I}{24\ ab}(b-a)$

$$= \frac{\mu_O}{4\pi} \frac{(I)\left(\frac{\pi}{6}\right)}{a} \text{ (coming out at pt "0")}$$

Mag. field at "0" due to arc BC $B_2 = \frac{\mu_O}{4\pi} \frac{(I)\left(\frac{\pi}{6}\right)}{b}$ (going inside atpt "0")

$\therefore$ Net mag. field B $B = B_1 - B_2$ (comoing out)

$$= \frac{\mu_O}{4\pi} \frac{\pi}{6} \cdot I\left(\frac{1}{a} - \frac{1}{b}\right)$$

$$= \frac{\mu_O I}{24}\left(\frac{b-a}{ab}\right)$$

$$= \frac{\mu_O I}{24\ ab}(b-a)$$

144. The forces on AD and BC are zero because mag.field d we to a straight wire on AD and BC is parallel to elementary length of the Loop and both the fields are in nuturally opposite direction.
